

WALK WITH TALK

API Specification

Last Updated: March 26, 2015

On error, end-points will return a JSON string describing the error in the following format:

```
"error": "The error message",  
"code": 200, // An HTTP error code  
"field": "The field that caused the error"
```

If the error is generic, that is, if the error is not restricted to a certain field (such as a duplicate username), all fields should be highlighted and the "field" key will contain `null`. A full list of HTTP error code and their uses can be found [here](#).

/URL	Methods	Description
/login	GET, POST	<p>Logs in a user.</p> <p>The GET action retrieves current user details. Results are returned in JSON format with the following fields:</p> <pre>"username", "sex", "age"</pre> <p>The same fields are expected during the POST action, in addition to password data in the "password" field. This is a SHA-256 hash of the data entered by the user into the form field.</p> <p>The submission will return a 401 if the data does not match an existing user, with a <code>null</code> value for "field". On success, there will be a code 200, as well as JSON data just like in the GET request.</p>
/register	POST	<p>Registers a new user.</p> <p>The POST action will expect the same fields as /login, in addition to a "password_confirm" field that follows the same characteristics as "password".</p> <p>The submission will return a</p>
